

I want to build an AI dance coach for ballet students and dance teams practicing together. The app would address the challenge of receiving immediate, specific feedback outside of class, especially when a teacher or coach is not available. Dancers could upload a short rehearsal video, and the application would analyze ballet technique, such as posture, turnout, arm placement, and balance, while also measuring how closely dancers move in unison. It would provide clear suggestions and visual feedback about timing differences or areas for technical improvement. This tool would be valuable because it would be more cost-effective than paying for frequent private coaching sessions. This tool would also be valuable because it could help dancers practice more intentionally and prepare for rehearsals, while supporting the guidance of a real dance teacher.
